Anemia Chat: Understanding anemia of CKD

Jay B. Wish, MD
Key takeaways

• Anemia is very common in patients with CKD and its frequency and severity increase with the severity (stage) of the CKD.

• Anemia causes many symptoms including fatigue, loss of stamina, shortness of breath and dizziness.

• The cause of anemia in most patients with CKD is iron deficiency and EPO deficiency.

• Iron and EPO replacement are effective in most patients with CKD, but there are side effects associated with high doses of both agents.

• New agents for anemia in the development pipeline can be administered orally and may offer greater convenience and patient access.
