

Kidney failure (ESRD) in Illinois

2021

34,458

Illinois residents

are living with end-stage renal disease (ESRD, or kidney failure). Without treatment—dialysis or a transplant—ESRD is fatal.

SOURCE: U.S. Renal Data System 2020 Annual Data Report

Only about 1 in 4 Illinois patients on the waiting list got a kidney transplant in 2020.

3,414 are on the waiting list for a kidney transplant

886 kidney transplants were performed in Illinois in 2020

SOURCE: Organ Procurement and Transplantation Network

5,466

New cases of kidney failure

were diagnosed in Illinois in 2018 (the most recent data available).

Why ESRD patients depend on charitable assistance

6,005

Illinois residents

on dialysis and with transplants received grants from AKF in 2020 to pay for their insurance premiums, emergency pandemic-related costs and other health care-related costs not covered by insurance.

\$23.5 million

in charitable assistance from AKF ensured that low-income Illinois dialysis and transplant patients could afford their lifesaving health care.

Most dialysis patients too sick to work

ESRD IS A DISABILITY

Dialysis is life support. Treating kidney failure and its comorbidities is more consuming than a full-time job: more than 80% of patients cannot work

Most patients AKF helps are minorities

MINORITIES ARE MORE AFFECTED BY ESRD

Of the patients AKF helps, 34.7% are Black 20.9% Hispanic/Latino 5.2% Native American/ Asian/ Pacific Islander

Ratio of out-of-pocket to income is stunning

FINANCIAL HARDSHIP COMES WITH ESRD

Average income of patients AKF helps is < \$25,000, yet average out-of-pocket costs for dialysis patients is >\$10,000/yr

9th leading cause of death in the U.S.

The facts about kidney disease

Kidneys are vital organs—just like the heart, lungs and liver. They clean the blood, help control blood pressure, help make red blood cells, and keep bones healthy.

- Chronic kidney disease is an increasingly common but usually preventable condition. **More than 37 million Americans have kidney disease** and millions more are at risk.
- According to the CDC, 9 out of 10 people with early kidney disease don't know they have it because it **usually has no symptoms until the late stages**. Simple blood and urine tests can tell how well the kidneys are working.
- Diabetes and high blood pressure are the **two leading causes of kidney disease**. Kidney disease can lead to heart attack, stroke, kidney failure and death.
- Kidney disease can be treated. If it's caught and treated early, it's often **possible to slow or stop the progress of kidney disease**.
- Besides diabetes and high blood pressure, other **common risks** for kidney disease include:
 - Having a **family history of kidney disease**
 - Being **Black, Hispanic, Asian American or Native American**
 - Being **over 60**
- Black Americans are **3.4 times more likely than whites** to develop kidney failure, and Hispanics are **1.5 times more likely than non-Hispanics** to develop kidney failure.

Kidney disease is a silent killer

- There are more than **785,000 people with kidney failure** in the United States—an **increase of more than 100% since 2000**.
 - About 555,000 are on dialysis and nearly 230,000 are living with kidney transplants.
 - Each month, **almost 11,000 new cases of kidney failure** are diagnosed.
- In 2018, Medicare spending for ESRD beneficiaries was **\$49.2 billion—7.2% of Medicare costs**—though **ESRD patients make up less than 1%** of the total Medicare population.
- A patient on hemodialysis costs Medicare **more than \$93,000 per year**.
- For each kidney disease patient who does not reach kidney failure, **Medicare saves an estimated \$250,000**.
- **One third** of people who were diagnosed with kidney failure in 2018 received **little or no pre-ESRD care**.

Costly to patients, employers and taxpayers
