Kidney failure (ESRD) in Oregon 2021

7,157 Oregon residents are living with end-stage renal disease (ESRD, or kidney failure). Without treatment—dialysis or a transplant—ESRD is fatal.

4,836 depend on dialysis to stay alive
2,321 have transplants

1,171 New cases of kidney failure were diagnosed in Oregon in 2018 (the most recent data available).

In 2020, only about 1 in 2 Oregon patients on the waiting list got a kidney transplant.

753 are on the waiting list for a kidney transplant
330 kidney transplants were performed in Oregon in 2020

Oregonians are at risk for kidney disease

Leading causes of kidney failure

| OR AT RISK: | 8.6% diagnosed with diabetes |
| High blood pressure | 30.6% |
| Self-report obese | 29.0% |

Why ESRD patients depend on charitable assistance

1,412 Oregon residents on dialysis and with transplants received grants from AKF in 2020 to pay for their insurance premiums, emergency pandemic-related costs and other health care-related costs not covered by insurance.

$3.8 million in charitable assistance from AKF ensured that low-income Oregon dialysis and transplant patients could afford their lifesaving health care.

Most dialysis patients too sick to work

80%

ESRD IS A DISABILITY
Dialysis is life support. Treating kidney failure and its comorbidities is more consuming than a full-time job: more than 80% of patients cannot work

Most patients AKF helps are minorities

>60%

MINORITIES ARE MORE AFFECTED BY ESRD
Of the patients AKF helps, 34.7% are Black, 20.9% Hispanic/Latino, 5.2% Native American/Asian/Pacific Islander

Ratio of out-of-pocket to income is stunning

28%

FINANCIAL HARDSHIP COMES WITH ESRD
Average income of patients AKF helps is $25,000, yet average out-of-pocket costs for dialysis patients is >$10,000/yr
Kidneys are vital organs—just like the heart, lungs and liver. They clean the blood, help control blood pressure, help make red blood cells, and keep bones healthy.

- Chronic kidney disease is an increasingly common but usually preventable condition. **More than 37 million Americans have kidney disease** and millions more are at risk.
- According to the CDC, 9 out of 10 people with early kidney disease don’t know they have it because it **usually has no symptoms until the late stages**. Simple blood and urine tests can tell how well the kidneys are working.
- Diabetes and high blood pressure are the **two leading causes of kidney disease**. Kidney disease can lead to heart attack, stroke, kidney failure and death.
- Kidney disease can be treated. If it’s caught and treated early, it’s often **possible to slow or stop the progress of kidney disease**.
- Besides diabetes and high blood pressure, other **common risks** for kidney disease include:
  - Having a **family history of kidney disease**
  - Being **Black, Hispanic, Asian American or Native American**
  - Being **over 60**
- **Black Americans are 3.4 times more likely than whites** to develop kidney failure, and **Hispanics are 1.5 times more likely than non-Hispanics** to develop kidney failure.

Kidney disease is a silent killer

- There are more than **785,000 people with kidney failure** in the United States—an **increase of more than 100% since 2000**.
  - About 555,000 are on dialysis and nearly 230,000 are living with kidney transplants.
  - Each month, **almost 11,000 new cases of kidney failure** are diagnosed.
- In 2018, Medicare spending for ESRD beneficiaries was **$49.2 billion—7.2% of Medicare costs**—though **ESRD patients make up less than 1%** of the total Medicare population.
- A patient on hemodialysis costs Medicare **more than $93,000 per year**.
- For each kidney disease patient who does not reach kidney failure, **Medicare saves an estimated $250,000**.
- **One third** of people who were diagnosed with kidney failure in 2018 received **little or no pre-ESRD care**.
